Skånetrafiken has chosen Mowic Network - once again

Skånetrafiken has chosen Mowic Network for mobile data communication between their busses and their central traffic control system. The traffic control system provides passengers, bus drivers and traffic control with quick and safe information concerning the traffic situation. The busses positions are reported in real time to provide an estimated time of arrival for the vehicles at bus stops along the route. Information is provided to the travellers by message boards at each bus stop and to the bus drivers using vehicle computers.

The agreement includes a service that provides mobile data communication as well as radio modems for 170 busses during a five year period. This is an increase of the same type of service that Skånetrafiken has used since 2003 which makes it a total of 240 busses that now uses Mowic Network in Skåne. The current bus routes are city traffic routes in Malmö and Eslöv as well as regional routes between Malmö and Lund, Svedala, Trelleborg, Falsterbo and Kristianstad.

"Mowic AB was chosen as the supplier since they were the only ones that could offer a wireless data communication service that could comply with our strict requirements on reliability and transaction times. Mowic has also shown large capability regarding the operation of their wireless radio network and their handling of installation and service of the radio modems that are included in the service" stated Krister Nordland, technical manager at Skånetrafiken.

Mowic have delivered wireless communication services in real time to professional users such as emergency services, service organizations, contractors and utility companies. "This increase of busses in Skåne that use the Mowic Network show that our commitment to the professional market that demand high quality and guarantees for their mobile data communication is completely right" stated Carl-Olof Henrikson, Mowic's Chairman.
